

**LEARNING INTENTION:**

**I can engage with others and represent numbers visually in a variety of ways.**

**Math Concepts:**

- Once you build flexible number sense with number below one hundred you can do the same with bigger numbers !
- Mental math strategies work for all numbers (once numbers get too large we use a trusty calculator)
- It's important to know multiples and factors of numbers

**Introduction:** Project *nrich* Multiplication Square Jigsaw <http://nrich.maths.org/5573/index>

Exploring the Multiplication Chart: What patterns do you notice?

What do you think of when you see the chart in this way? What do you wonder?

Refer to the learning target.

Students each review a table copy of the colored multiplication table

Co-construct what students already know about multiples and factors.

**Lesson:** Introduce the story context from *The Great Divide: A mathematical Marathon*

Turn/talk/listen to other ideas when we divide and multiply in our daily lives.

Pause when the racers become 5 -predict how the pattern changes here.

Demonstrate the part/part/whole bar model to represent the pattern as you read the story.

This is one model. There are a variety of ways

Introduce 3 **models** to show part/part/whole thinking: Array

Groups of/sharing models

Singapore Bar

Invite students to choose a particular number from the multiplication chart, stand up at a vertical non-permanent surface & concretely represent their number. Combine stickies with a learning partner to choose a number to represent 18, 24, 28, 35, 36. What will you do if your number is prime? With dry erase marker show groups of and Singapore Bar visual model to represent models of a number (part/part/whole)

**Reflection:** put a sticky on the model that most clearly represents your understanding of number visually today? Fill in thoughts about math learning (see reflection sheet)

**Closure:** Demonstrate/model - [Thinking Blocks.org](http://www.thinkingblocks.org)

is division anyway?  
 When do we divide?

What do you know so far?

Dividing groups of things equally  
 it gets difficult - sometimes you have "left overs" that can't be shared evenly

$20 \div 4 = 5$    $13 \div 3 = 4$  with one left over

remainder 

- sharing candies
- dividing one whole thing into parts
- sharing a box of drinks
- dividing up a box of donuts
- sharing balloons evenly
- breaking things apart evenly
- repeated subtraction
