# **Student Designed Laminated Project**

#### Name:

- Design your laminated project in Fusion. Follow the video tutorials on how to draw it in 3D and produce a 2D working drawing that you will use. You <u>MUST</u> have a minimum of 4 pieces of wood.
- 2. Complete a Bill of Materials as shown by your teacher.
- Have both your drawing and the Bill of Materials approved by the teacher by having it initialled. <u>DO NOT</u> loose the drawing as it becomes part of your mark later and is used for measuring.

4. Add the FINISHED & ROUGH SIZES of each piece of wood in the Table below (Minimum 4 pieces)

### ROUGH SIZE OF EACH PIECE OF WOOD MUST BE AS FOLLOWS;

Thickness:	must be close to 1 inch			
Width:	oversize by ¼" to ½ inch			
Length:	oversize by ½" to 1 inches			

Item	Qty	Name	Material	FINISHED SIZE (thick x width x length)	ROUGH SIZE (thick x width x length)

- 5. Go to the short ends bin **FIRST** and select your wood if possible. Only after you **CANNOT** find a piece of wood in the short ends bin and you have **ASKED** the teacher, can you take from the main wood pile.
- 6. Layout the size of wood you require on the wood you have chosen and have the teacher check it. **ONLY** after the teacher has checked it do you proceed.
- Using the Mitre Saw, cut to <u>ROUGH LENGTH</u> the pieces you need. Rough Length is: \_\_\_\_\_\_
  REMEMBER it is ½" to 1" longer than your final length.

- If necessary, go to the table saw and rip any extra wood and return it to the short ends bin.
  (Do this if the board is more than 1" wider than you need)
- 9. On all pieces, use the jointer (check for it being square)
  - Joint a FACE SIDE (and mark it)
  - Joint a FACE EDGE (and mark it)
  - Go over the wood as few times as possible to make the boards flat and square.

## 10. Rip ALL pieces on the Table Saw to final width(s).

Item	Final width of pieces

- 11. Dry clamp the pieces together (Look at the diagram below for gluing correctly)
  - Clamp <u>ALL face sides</u> on the same side and as even as possible.
  - If there are any gaps between the pieces, go back to the jointer.
  - have it checked by the teacher.

- 12. Glue the project together (Use damp paper towel to remove excess glue)
  - If it will contact water, use the waterproof glue!
- 13. After it has dried (next class), if any glue remains use a scrapper or chisel to remove it.
  - clamp the project to bench.
  - If using a chisel, push it AWAY FROM YOU with your hands behind the blade!!

### 14. Plane to thickness (If it is NOT FLAT, see the instructor)

- put the face side down first and plane the opposite side smooth.
- flip the board over and plane the face side smooth.
- try and keep the board as thick as possible.
- 15. Using the **Crosscut Table saw** or **Mitre saw**, cut one end square and mark it. Final Length is: \_\_\_\_\_\_ Then, cut to final length.
- 16. Re-create the shape of your cutting board by cutting it out one of the following ways;
  - go back to your computer and proceed to setup the CNC router to cut the shape out.
  - use the Band Saw to cut the corners round then Belt Sand
- 17. Do any other operations such as drilling holes or routing the edges.
- 18. Sand your project starting with 80. Continue with 120, 180 and 220 grits. Don't forget the end grain!
- 19. Apply a finish.
  - 2 coats of mineral oil if the project is to be used as a cutting board (1 per day)
  - 3 coats of water-based stain with a brush (1 coat per day). Sand with 400 in between coats.
- 20. Complete an evaluation sheet and submit for marking (include you Drawing & Bill of Materials).
